“APPLICATION OF BOBATH EXERCISE

Consist of 5 Bab, 47 chapters, 5 table, 2 chart, 11 picture, 3 attachment

Background And The Aim Of Scientific Paper : A child's growth and development disorder, commonly known as Delay Development, is a disorder that attacks the child's growth and development process, this is a developmental disorder regarding several cognitive, gross, fine, and emotional domains of children. The purpose of this scientific paper is to determine the effect of Bobath Exercise the ability of functional activities with Delay Development conditions.

Methods : This scientific paper is a case study which on this occasion raises the patient's case, analyzes and collects data through the implementation of physiotherapy. Then the physiotherapy modality used in this case study is Bobath Exercise which is carried out five times with the DDST II (Denver Development Screening Test II)

Result : After doing therapy five times using the Bobath Exercise modality, the result haven't improved much, just a little change.

Conclusion : With the result obtained from the implementation of this physiotherapy, there is a slight change in the postural changes of the patients with Delay Development conditions, but there has been increase in the ability of functional activities. In addition, families or patients of children do not regularly come to therapy and provide less stimulation a children at home so that there is only slight increase.

Keywords : Bobath Exercise, Delay Development. growth
